

HELP YOUR PET HEAL!

FOR THE NEXT 7-10 DAYS

©2025 ASPCA®. All rights reserved.

NO LICKING!

Licking or chewing at the incision can cause infection.

KEEP IT DRY

Water affects surgical glue and opens the incision, causing infection.

CHECK THE INCISION

What you see today is normal. Check twice a day for redness, swelling, or discharge.

(The small, green tattoo indicates spayed or neutered.)

INCISIONS ON MALES ARE

It is normal to see swelling and red discharge for a few days during the healing process.

SEPARATE ANIMALS

Keep females away from un-neutered males.

FEED A SIMPLE DIET

Do not give your pet junk food, special treats, table scraps, or milk.

RESTRICT

ACTIVITY

Inside rest gives the tissue time to heal and helps the incision stay closed. (No running, jumping, or playing.)

NO HUMAN MEDICATION!

It is dangerous and can be fatal! Your pet has already received long-acting pain medication.

We will make every reasonable effort to treat at our clinic, at minimal cost, any postoperative complications resulting directly from the surgery, if these instructions are followed in full. Your regular veterinarian must address illnesses or injuries that are not a direct result of surgery.
